

# ALLinHELP

**Company:** AllinzucolSmartSystem Lab

**Document Owner:** Product Team

**Last Updated:** July 2026

**Version:** 1.0 (Foundation)

**Status:** Draft for Approval

**Platform:** AI-powered LSOS

## 1. Executive Summary

**ALLinHELP** is an AI-powered Local Services Operating System (LSOS) that connects individuals, households, businesses, and organizations with verified local service providers through intelligent matching, location awareness, trust analytics, and AI-assisted pricing.

Unlike a traditional classifieds or job board, ALLinHELP acts as an intelligent decision platform that recommends the most suitable helper based on multiple real-time factors, including proximity, availability, skills, reputation, pricing, and customer preferences.

The long-term goal is to become the leading AI infrastructure for trusted local services across Africa.

## 2. Problem Statement

Finding trustworthy local helpers remains difficult for customers because:

- There is no standardized way to verify helpers.
- Pricing is inconsistent.
- Customers often cannot identify qualified workers nearby.
- Communication is fragmented across multiple channels.
- Safety and trust are recurring concerns.
- Many skilled workers struggle to reach nearby customers.

Businesses also face challenges in finding temporary or on-demand workers quickly.

## 3. Product Vision & 4. Mission

**Vision:** To build Africa's most intelligent AI-powered platform for discovering, matching, managing, and paying trusted local service providers. ALLinHELP aims to become the operating system for local work by combining AI, geolocation, secure identity verification, digital payments, and analytics into one platform.

**Mission:** Empower people to find trusted local help within minutes while helping skilled workers access more opportunities, increase earnings, and build trusted professional reputations.

## 5. Key Objectives

### Customer Objectives

- Find verified helpers quickly.
- Receive fair AI-assisted price recommendations.
- Track helpers in real time.
- Pay securely.
- Build long-term relationships with trusted helpers.

### Helper Objectives

- Receive nearby job opportunities.
- Reduce idle time.
- Increase income.
- Build a professional reputation.
- Manage bookings and payments efficiently.

### Business Objectives

- Generate recurring revenue through marketplace transactions.
- Build a scalable AI platform.
- Expand into multiple service industries.
- Create reusable AI infrastructure for future products.

## 6. Target Users

### Primary Segment

- Households & Families
- Busy professionals
- Office managers & Small businesses
- Property managers
- Hotels & Short-let operators

### Secondary Segment

- Independent service providers
- Skilled tradespeople & Freelancers
- Domestic workers
- Students seeking flexible work

## 7. Supported Service Categories (Initial)

*Note: The category list must be configurable by administrators.*

Cleaning

Laundry

Cooking

Babysitting

Elder care

Office cleaning

Office assistance

Plumbing

Electrical work

Carpentry

Painting

Generator repair

Air-conditioner repair

Appliance repair

Gardening

Driving

Dispatch services

Home tutoring

Pet care

## 8. Core Product Components

| Component           | Description & Capabilities                                                                                |
|---------------------|-----------------------------------------------------------------------------------------------------------|
| Customer Mobile App | Allows customers to search, book, communicate with, pay, and review helpers.                              |
| Helper Mobile App   | Allows helpers to manage profiles, availability, bookings, navigation, earnings, and reputation.          |
| Web Platform        | Supports customer access from desktop browsers.                                                           |
| Admin Dashboard     | Provides operational oversight, analytics, moderation, support, and configuration.                        |
| AI Services Layer   | Supports intelligent matching, pricing, trust scoring, fraud detection, forecasting, and recommendations. |

## 9. Functional Requirements

### Customer Features

- Account registration & Login
- Identity verification & Profile management
- Location detection & Service search
- Create service requests & Upload images
- View AI price recommendations
- Select preferred booking time
- Track assigned helper in real-time
- In-app messaging
- Voice communication (*future phase*)
- Secure payment & Wallet
- Booking history, Ratings & Reviews
- Notifications & Emergency assistance

### Helper Features

- Registration & Identity verification
- Profile creation & Skills selection
- Availability schedule management
- Service radius configuration
- Accept or decline job requests
- Navigation support
- Earnings dashboard & Wallet
- Withdrawal requests
- Performance dashboard & Ratings
- Notifications

### Administrator Features

- User management & Helper verification
- Service management & Pricing configuration
- Analytics dashboard & Financial reporting
- Customer support & Marketing management

## 10. AI Requirements

The AI platform leverages intelligent microservices to automate and optimize marketplace dynamics:

| AI Engine                       | Functionality                                                                                     |
|---------------------------------|---------------------------------------------------------------------------------------------------|
| AI Adaptive Matching Engine     | Recommend the most suitable helper based on multiple weighted factors.                            |
| AI Fair Price Prediction Engine | Recommend fair pricing using service, location, travel, duration, urgency, and market conditions. |
| AI Trust Intelligence Engine    | Continuously update trust scores for customers and helpers.                                       |
| AI Demand Forecasting Engine    | Predict service demand by location and time.                                                      |
| AI Intelligent Dispatch Engine  | Assign jobs efficiently while minimizing travel distance and response time.                       |
| AI Fraud Detection Engine       | Detect suspicious behavior, fake accounts, and abnormal marketplace activity.                     |

## 11. Booking Workflow

- 01 Customer selects a service category.
- 02 Customer enters location and job details.
- 03 AI validates the request integrity and requirements.
- 04 AI estimates a fair price based on real-time market data.
- 05 AI searches for nearby available verified helpers.
- 06 AI ranks helpers based on the matching model weights.
- 07 Job notifications are sent to the highest-ranked candidates.
- 08 A candidate helper accepts the request.
- 09 Customer confirms the selected helper.
- 10 Navigation and tracking begin for the dispatch.
- 11 Service is completed at the designated location.
- 12 Payment is processed securely via digital wallet/gateway.
- 13 Both parties submit ratings and qualitative reviews.

## 12. Non-Functional Requirements

### Performance

- Fast search and matching
- High platform availability
- Responsive interface
- Low booking latency

### Scalability

- Support millions of users
- Horizontal scaling architecture
- Cloud-native deployment

### Security

- Encrypted communication
- Secure payment processing
- Identity verification
- Role-based access control (RBAC)
- Audit logging

### Reliability

- Fault tolerance
- Backup and disaster recovery
- Continuous monitoring and alerting

## 13. Revenue Model & 14. Success Metrics

### Revenue Streams

- Commission on completed bookings
- Premium helper subscriptions
- Featured listings & placement
- Enterprise business plans
- Service protection fees
- Advertising opportunities
- Payment processing revenue

### Success Metrics (KPIs)

- Customer & Helper acquisition
- Verified helper rate & Repeat booking rate
- Booking completion rate
- Average response & matching time
- CSAT & Net Promoter Score (NPS)
- Gross Marketplace Value (GMV)
- Monthly recurring revenue (MRR)
- Fraud & Dispute rates

## 15. Assumptions & 16. Risks

### Key Assumptions

- Users have internet-enabled smartphones.
- Location services/GPS are available.
- Digital payment options are supported.
- Helpers can complete identity verification.
- Local regulations permit marketplace operations.

### Identified Risks

- Low marketplace liquidity during launch.
- Fraud and identity abuse.
- Pricing disputes.
- Regulatory changes.
- User trust and safety concerns.
- Slow adoption in new markets.

*\*Each risk must have an assigned owner and a mitigation plan prior to launch.*

## 17. MVP Scope

### Included in Initial MVP

- User registration and authentication
- Identity verification
- Service categories management
- Booking requests
- GPS-based helper discovery
- Basic AI matching
- AI price recommendation
- In-app chat
- Payments & Wallet integration
- Ratings and reviews
- Admin dashboard

### Deferred to Later Releases

- AI demand forecasting
- Voice assistant
- Video calling
- Predictive scheduling
- Multi-language AI assistant
- Enterprise APIs
- Insurance integration
- Smart contracts
- Advanced BI dashboards

## 18. Product Principles

- ✓ Trust by design.
- ✓ AI should assist, not replace, user choice.
- ✓ Safety is a core feature.
- ✓ Fairness for both customers and helpers.
- ✓ Transparent pricing recommendations.
- ✓ Privacy-first handling of user data.
- ✓ Modular architecture for future expansion.

- ✓ Measure every critical workflow with analytics from day one.
